

THE PROBLEM

Everyone wants a personal assistant, but real human PAs are a luxury reserved for the wealthy and the C-suite. Everyone else manages their own life across a dozen disconnected tools — reminders in one app, groceries in another, food delivery in a third, tickets in a fourth — with no single place that knows their preferences, routines, or context. Typing into each app is slow and error-prone in regional languages, and a real barrier for lower-literacy or older users. What people actually want isn't another app — it's someone who knows them and handles things.

THE SOLUTION

Niko is a voice-first AI personal assistant that lives with you day to day — not a single-purpose ordering bot. Call in or open the app and simply talk to Niko the way you'd talk to a human assistant: set a reminder, plan the week, order groceries, get food delivered, shop for something, or book tickets — all in one ongoing relationship, in your own language and words. Niko remembers preferences and context across requests, handles the task end to end, and confirms out loud. Once a task is placed, Niko hands the flow off to WhatsApp: confirmations, live tracking, provider chat, receipts, and reordering all happen there, where users already expect to manage things asynchronously.

- Voice layer (primary): an ongoing personal assistant relationship, not a one-off command — reminders, planning, and task execution, by phone call or in-app voice, in regional languages and dialects
- Memory layer: Niko learns preferences, routines, and context over time so requests get faster and more personal
- Task-execution layer: AI figures out intent and routes to the right category and fulfillment partner automatically — groceries, food, shopping, tickets, and beyond
- WhatsApp layer (handoff): confirmations, order/ticket tracking, provider chat, receipts, and easy reorders

WHY NOW

Real-time speech-to-text and voice AI have crossed the reliability threshold for noisy, accented, code-switched speech at consumer scale, and LLM agents now have the memory and planning ability to act like a genuine ongoing assistant rather than a single-command bot. WhatsApp Business API access has matured as the ideal async layer once a task is placed. Together, this makes a true personal AI assistant — one relationship, not another app to open — possible for the first time for everyday people, not just the C-suite.

BUSINESS MODEL

- Subscription for the personal assistant relationship (freemium core, paid tier for deeper memory, proactive planning, and priority execution)
- Take-rate commission (5-8%) on completed orders and bookings executed through Niko
- B2B2C distribution via telecom voice-call bundling and category partnerships (grocery chains, restaurant aggregators, ticketing platforms)

WHY THIS FOUNDER

This is a direct extension of a decade-plus spent building conversational, voice, and messaging-first products for underserved users at scale: Innoz brought search to any phone over SMS by hustling telecom partnerships firsthand; Lookup built a hyperlocal discovery layer connecting consumers to nearby shops; KiranaPro is currently running live, ONDC-integrated voice AI ordering for kirana stores across India, proving speech-to-cart ordering works at scale in exactly this market. Niko widens that instinct from a single category into a true personal assistant — same mission, a deeper relationship with the user, powered by modern voice AI.
